NOTE:—Successful propagators have found that they must use Oriental understock for Japanese Flowering Cherries. The closer the relationship between understock and graft the better the results.

STRATIFICATION Cherry Seed requires about four months to afterripen. Outdoor stratification is not always satisfactory. The best known method is to stratify in moist sand in an ice house, maintaining 38 deg. to 41 deg. F. Care should be taken to keep the box moist at all times. Place in stratification sufficiently early so that the seed is fully afterripened as soon as Spring permits sowing outdoors.
